Imbedded Disk Magnets

Figure 3

Keep the gauge perpendicular to the table
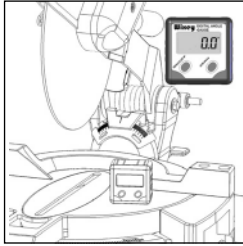

Figure 4

INSTRUCTIONS

1. Set the gauge flat on a reference surface such as a table saw, miter saw, or jointer table. On a band saw, the blade will be the reference surface.

2. Turn ON and press the ZERO to set the gauge to 0.0 degrees which calibrates the reference surface. (see **Figure 1**)

3. Attach to the saw blade or jointer fence using the imbedded magnets. (see **Figure 2**) The gauge should always be kept perpendicular to the table for all measurements. (see **Figure 3**)

4. A properly adjusted saw blade, jointer fence or band saw table will display 90.0 degrees. If the reading is off, re-adjust your machine following the manufacturers instructions. (see **Figure 4**)

5. Now you can press ZERO to set the gauge to 0.0 degrees and measure the angle of your saw blade, jointer fence or band saw table. (see **Figure 5 & 6**)

6. Replace the battery by rotating the cover on the back of the gauge counter clockwise. (see **Figure 7**)
